- Contribution 2.
- Contribution 3.

2 Related Work

Foundational surveys frame the bot-detection problem [1,3,8]. Benchmark datasets define the empirical landscape [4–6]. Behavioural-feature and tool-based detection methods [10, 11] establish the single-dataset baseline this work builds on. Studies of real-world bot activity in political events motivate the cross-era question [2,7,9].

3 Datasets

Dataset descriptions go here.

4 Feature Engineering

Feature engineering pipeline goes here.

5 Methodology

Methodology goes here.

Figure 1: Cross-era AUC for a logistic-regression bot detector. Each line is one training dataset; the x-axis is the test dataset in chronological order. *TODO: rewrite caption with real numbers once results are final.*

6 Experiments and Results

Results discussion goes here.

7 Discussion
